

## Analytics

Throughout the process of completing this project we've learned the importance of communication. This ranges from trying to schedule team meeting to organizing the portions of code each team member does.

One Enormous challenge we faced was finding time to meet, because of our busy schedules both in and out side of school, the only time we could meet was before and after class, this made conducting weekly SCRUM very difficult.

Another challenge we faced was attempting to combine the different skill levels of our team. Since the conception of the project we have had a hard time finding a lowest common denominator in the sense of coding experience in particular languages. This caused a level of lag in the production of our website, because it took time for team members to become acquainted with languages. Additionally, we found that a large amount of production was saved for the last minute which caused faults in the coding style and documentation.

Maintaining levels of accountability is difficult when the group only meets so often and when group members become unresponsive and or unable to attend meetings, this then adds to the lack of communication our group faced. Which at times caused conflicts in code and in logic which in turn wasted valuable group time.
